

# Android Fundamentals Project Description

## - Competitive Hearthstone Subreddit

### Android App

**Problem:**

Hearthstone: Heroes of Warcraft is a digital collectible card game by Blizzard Entertainment. Metagaming of the game which refers to trend of popular classes to play, popular cards to be included in a deck, popular deck types etc. changes considerably weekly and significantly influence the winning ratio of a players especially players that join tournaments. The Competitive Hearthstone subreddit at <http://www.reddit.com/r/CompetitiveHS> lets competitive players discuss, ask for opinion and learn from each other. The followers of the subreddit may need some help to keep up this highly active subreddit.

**Proposed Solution:**

Design an app that regularly fetch subreddit posts and notify the users when there are new posts. The subreddit posts together with their first level comments are stored locally and users can browse and read them any time without wasting the bandwidth. If a particular comment is highly interested, the users can click on the comment to view the replies in a browser.
